

For example 1: If the initial stack with size=5 is empty and the numbers 5, 10, 15, 20 are pushed in that order and popped 4 times, then 25, 30, 35 are pushed in that order and popped 2 times, what value will remain on the stack?

Answer:

For example 2: If the initial stack with size=5 contains the numbers [10, 20, 30, 40] , and is popped twice, then pushed 50, 60 in that order, then popped 3 times, what value will remain on the stack?

Answer:

For example 3: if there is no stack's instance variable before, write statements in main program to create the instance variable mystack with size=5. Then push the number 1, 2, 3, 4, 5 in that order, and pop 3 times by using class Stack's methods that we learned.

Finally write the element that remain on the stack's instance variable mystack.

Is Different from

For example 3.1: if there is the exist stack's instance variable `mystack` with `size=5` contains the numbers `[10, 20, 30, 40]` ...
